

Microsoft Access Upsizer

Convert your existing Microsoft Access database into a QuickBase application

This utility automatically creates a new QuickBase application from an existing MS Access mdb or accdb file. The new application will contain all **tables** including **relationships**, **fields** with their corresponding field types and a standard data entry **form** for each table. It will also create a "subform" to include any related data from the Parent -->Child table relationships if applicable.

Our service will **save you many hours of development time** when choosing to move from Microsoft Access to QuickBase. After the process is completed, the new QuickBase application that is created will be ready to use and then you or your team can provide further customizations to utilize the power of QuickBase.

What our process will do...

- ✓ Create all **tables** and all the appropriate **fields** defined with their respective **field types** based on how they are defined in your Access database
- ✓ Create all **relationships** as they are defined in your Access database
- ✓ Import all **data** into all tables, relating the data between the tables so that your data is "connected" as it was in your Access database
- ✓ Create a **default form** for each table with all fields displayed within it including any **subtable reports** for displaying related data based on table relationships

What it will not do...

- ✓ Convert reports from your Access database
- ✓ Convert macros and/or modules defined in your Access database
- ✓ Convert any event driven VBA code defined in your Access forms
